Some very early users also had their own unique naming conventions. As AutoCAD became more popular, the number of users grew, resulting in some naming conventions evolving into formal standards. The more traditional names for a drawing include the initials of the user, followed by the day, month, and year in which the drawing was created, as in MDA14.1. This type of naming scheme is by far the most common. Beginning with release 2002, AutoCAD allows users to choose a custom name for their drawings. This means that you can use any letter of the alphabet and any combination of letters, numbers, and hyphens. You can also specify an abbreviation of the name you select for your drawing, like crd for a customer record drawing. To create a custom name for a drawing: Choose Manage Data from the Manage tab. Click the Create Drawing button. Specify a name and other options for the drawing. For more information about creating a custom name, see Customize drawing names.

Because pesticide residues are commonly found in fruits and vegetables, test methodologies for the analysis of pesticide residues must be suitable for testing these commodities. To examine this issue, results from conventional and high-performance liquid chromatography (HPLC) analyses of a number of pesticides in tomatoes and apples were compared using their respective most appropriate techniques. The results showed no significant difference between the conventional and HPLC methods for the majority of pesticides, but some differences were found for atrazine and permethrin in tomatoes. In apples, significant differences between conventional and HPLC methods were observed for diazinon and chlorfenvinphos. The principal reason for the differences observed was that conventional methods, which use QuEChERS, a salt-based sample preparation method, were only able to extract pesticide residues at low levels of contamination and recovery for most pesticides. The differences observed in the recovery rates of pesticides between conventional and HPLC techniques for apples suggested that HPLC is the most suitable test method for detecting these pesticides. The HPLC results for the pesticide content in apples were also not significantly different from those obtained with a previously validated conventional method.Мобильные телефоны «все меньше и меньше, но всё меньше престижно», — заключает замглавы администрации президента в департаменте коммуникации Минюста Александр Андреевич Малинов. In recent years, inkjet printers have been rapidly gaining popularity as a printing apparatus for printers and copying machines, because of the characteristic that a comparatively cheap and compact inkjet printing apparatus can produce a comparatively high image quality image at a comparatively low cost. An inkjet printing method may be classified into a continuous method and a drop-on-demand method, depending on the method used to control ink drops. In the continuous method, ink drops are continuously ejected from a nozzle, and the ejected ink drops are made to adhere to a recording material, e.g., paper, while the ink drops are allowed to fly so that a high-resolution image can be formed with a high degree of precision. In the drop-on-demand method, an ink drop is ejected from the nozzle according to image information, and the ink drop adheres to the recording material only when it is required to form the image. The print head of an inkjet printer is provided with a plurality of nozzles for ejecting ink drops. The nozzles may be arranged in a plurality of blocks so that different colors can be discharged from respective nozzle groups. For example, the print head may be provided with cyan, magenta, yellow and
