We finally managed to deploy updated Office 2010 to some of our clients. The initial reaction was that everyone was pleasantly surprised by the number of features it included, such as Rich Text Editing. It took us a bit to find out that the basic installer of Office 2010 doesn't include it. We were actually able to install the basic version of the Microsoft Office 2010 Suite by using the "Add Features to an Office version" feature. We needed to install the basic Office 2010 from the DVD, because it includes SQL Server Reporting Services, which was a requirement for some of our clients. We found it quite hard to find out how to do that. We found the Microsoft help topics for this quite strange, as they start off by telling you that the basic setup will be enough, but after that they mention that you need to buy additional features. Perhaps they should be encouraged to review their help system in future, so they could include the right information. But eventually we managed to find the basic version of Office 2010, which required a separate installation. It is weird that the basic version doesn't include the Core installation, which probably should be there by default, as it probably isn't that hard to implement. It is more of a question of habit, but it is certainly a strange one. After installing the basic Office 2010 version, we had to install the SQL Server Reporting Services in order to be able to create reports. Once we finished installing it, we realized that it would be a good idea to install the basic version of SQL Server Express, as it is required by the SQL Server Reporting Services installation. The installation process was quite straightforward, although it was quite long, as it took a bit of time to complete, due to the fact that it required upgrading an existing installation. It is possible to cancel the installation at any time, but we found it more convenient to let it run its course. Once we finished installing the reporting service, we were left with a simple installer which asked us to restart the computer. It is very simple to install Office 2010, which is a good thing, as it is a straightforward installer. Some of our clients had some problems when installing the basic version of Office 2010 on their computers. The help files were not very detailed, and it wasn't

During my years at MIT, this was my go-to search engine for finding information, news, and blogs. But as time went on, my tendency to search first with Google started to slowly slip away. At first, this started with occasional searches for well-known MIT names or projects that I was working on. Then, it slowly moved on to more obscure names and research topics. At the same time, it felt like the Googling was taking more time than it used to. Eventually, my once-once-daily Google habit became a daily Google habit, in which I would hit Google and expect to find the answers to my questions in the first result. I've come to realize that my new habit is not unique. In fact, most of us spend much of our day switching back and forth between two or more web services, depending on what we need to accomplish. As MIT's Tom Friedman once wrote, "It's hard to remember a time when we didn't have two identities: one public and one private. If you know what you're doing, you can use your private self to your public advantage. For the rest of us, the only way we're going to be able to keep the two parts of ourselves separate is to try to have no identity at all." These two identities, public and private, have become increasingly common as more and more people create their own personal sites or blogs, as many of us consume news and information online, and as increasingly young people go to school online. At first, I thought the online world was a tool for me to explore my private interests, like learning about myself and my life, and to learn about my work, like analyzing research and testing new ideas. Now, I've realized that the online world is just as much a tool for me to work on my private interests, by helping me learn more about my work,
