Over the last few years, the Windows 10 operating system has been more than just a new version of Windows. It's become the foundation of modern computer systems. As a result, you're no longer expected to spend much time cleaning up your PC. You simply get on with your life and leave your computer alone. If the PC starts to slow down though, it's time to look at what's eating up the computing power. This is where System Genius comes in. It scans your PC and removes the background processes that're causing the PC to run more slowly. This is a great time-saver as it means your PC will run faster. Once System Genius has completed its scan and found items that it can remove, you'll be shown a screen telling you what it's done and how it's removed the items. Features: Automated scan System Genius is not just a means to remove items that will cause your PC to run slowly. It is also a way to scan your PC to find which apps you use regularly and which can be uninstalled. These apps are the ones that are sucking up the computer's resources. Even if they're not slowing down your PC, they're still taking up hard drive space. You can also use System Genius to uninstall any startup programs which can be found under the Startup list. Full disk scan System Genius is also a full disk scan utility. It can not only find files you don't want or need, but it can also find apps and programs which you'd like to un-install. Remove files System Genius can detect and remove all types of files, such as folders, shortcuts, libraries and archives. You can also keep selected files, such as pictures or videos you'd like to keep. Clean Registry System Genius can detect and remove entries from the Registry. If you have the registry cleaned out, your PC should run faster. Create restore point System Genius can also create a restore point to ensure you always have your PC backed up. This makes it easier for you to roll back to a state before the removal process began. Quick scan When System Genius detects a large amount of data or files, it can attempt to analyze them more quickly. This is normally enough to allow the app to find all it needs to remove. System Genius is also a great way to protect your computer. If you scan for items that you no longer want or need, you'll free up space. You can also run a quick scan to protect yourself

File system The file system is an independent part of the computer's hardware. It organizes the files on the hard drive and keeps track of them. In Windows, files are organized in NTFS. The NTFS is the file system used on Windows 8 and higher. Windows 7 and lower use FAT32. Operating system This is another separate part of the computer's hardware. It controls all the features the computer has, like the screen, the keyboard, and the hard drive. It allows you to open programs and perform other tasks. In this case, the file system and the operating system are connected. They work together to allow Windows to keep track of the files on your hard drive. File Name The file name is an important thing for Windows to be able to find the file. When you create a new file on your hard drive, it automatically gets a file name.
