Adobe is branching the Adobe Graphics product line into two distinct families. The first, Lightroom and Elements, will support GPU acceleration, with new APIs including OpenGL and Metal. Adobe makes up the difference for these APIs with powerful CPU-based acceleration built into the Core Image graphics software. The second, Illustrator and Photoshop, will be available only on Mac and Windows and continue to use the legacy software APIs, GPU-accelerated or not. These are the native APIs of the last decade, and are the only way for Photoshop to leverage Mac and Windows-optimized 3D and hyper-speedy CPU-based compositing tools. Stay tuned here for news about future features in this family! The Mac App Store will also make available updates to the Mac versions of the latest releases of Photoshop and related apps, such as Photoshop Plug-ins (see "Adobe Photoshop Plugin Compatibility"). There are even color-correction plug-ins for the Mac, including Kolor.com's popular Omen, which can do color adjustment, and the new popular Curves plug-in, which lets you define the lightness, color, contrast, and saturation of an image. Kolor offers a mobile app that gives access to the photo management and editing tools of Kolor.com, including the universe of Kolor color-correction plug-ins. As Photoshop developer Adam Sczankowski said, "This is really about bringing Photoshop to the Mac. It's about bringing the best imaging tools to the Mac platform without the compromises of the Windows version. By making it work the same way on the Mac as on Windows, we're confident it will make it easier for users to get the most out of a Mac computer."
