Immensely powerful program for professional work. I've never encountered such a user friendly program for work as a professional. On the whole you really can't beat this one and it will certainly satisfy most of the needs of the majority of serious photographer. Once you learn the basics, of course, - you won't need to refer to the manual. Production-wise you have a lot of liberty. Of course the software is not so intuitive as for example Lightroom, which I use. I must admit that the Photoshop tool system is not nearly as intuitive as Lightroom. Other editors which can accomplish everything Photoshop can do are unfortunately not nearly as simple. Nevertheless this software is not that easy. Steve, a lot of people are complaining about the update but that is what Adobe does. Adobe has a rigorous internal test of upgrades and this one was deemed a good candidate for release. I imagine that many of the bugs you mention were fixed in the previous update. It is funny how after the first update, one new feature sticks in my mind and that is the red-eye removal. I simply loved the red eye feature. I cannot say enough wonderful things about this software. Overall, once you figure out ways to rampup productivity, it's pretty easy and fast. If you are relatively new to the hobby and don't want to learn all the ins and outs, it's a worthy upgrade, and a very clever way to work. PS and Lightroom is a great combination. Both have worked together for many years. However I think I've concluded that Lightroom is easier to use in spite of the fact that it lacks some of the features that Photoshop offers.

Selections – Add ability to change the shape of selection (remove corners, square, or eyelash, for example). Now, an Edit button appears when a selection is active, allowing users to better control edit, kill, and other selection commands. Separate Edit commands all within the context of the active selection, instead of moving to the Edit menu. Simplify and remove some of the Duplicate, Move, Mirror, and similar command options available in the Select menu, and focus on moving selections in the active document. Users also gain the ability to Auto-Adjust using the pre-editing grid and to give exact Pixel blobs to a selection. **Navigation** – New navigation system designed to be more Pixel aware. The text and icon navigation bar files can be edited to use a secondary interpolation phase between the two axis, making navigating Pixel-sensitive paths much easier. Users will be able to move the text and icon navigation bars to a secondary canvas and then interact directly with the Pixel-sensitivity of any path. **Blind Editing** – Select all the objects in the path and change the properties of them, without affecting the rest of the image. Users can now, in any active path, select all the objects to change their color, fill, stroke, and alpha layer properties. Users can also apply any Layer Mask or Exposure adjustment without affecting the non-selected objects. **Direct Path Mode** – Now it's easier for users to work directly with paths. Select an area within an image and create a path by clicking-and-dragging from the highest point. Change the path's shapes in real-time, and the update happens instantly on the users' screen.

Features include hardware-accelerated Raster to Vector (ATV) conversion, which enables Adobe Flash Professional users to convert a sequence of raster images to vector formats such as AI, DWG, or PDF, without using an external program. It also includes hardware-accelerated H.264 video decoding, which enables users to view H.264
